

MORNING ALARM

ASSEMBLY & OPERATION GUIDE

Wake Up to a Brighter Day!

Bright
Ideas
for a
Better
Tomorrow!

Setup Steps

- 1 Prepare the Chassis by following the "Steps to Assemble Chassis" on Page 3
- 2 Mount the battery Holder on Chassis at Position 1 using Velcro
- 3 Mount the PCB Board on the Chassis at Position 2 using Velcro.
- 4 Mount the LDR Sensor on the Chassis at Position 3 using Velcro
- 5 Connect the LDR Sensor to the Sensor JST connector on the PCB board using the 3-pin to 3-pin JST cable
- 6 Mount the Buzzer on the chassis at Position 6 and connect JST connector in the CON1 JST connector on the PCB board
- 7 Connect the Reverse JST cable to REV JST connector on the PCB board
- 8 Connect the Battery Holder to the Power JST connector on the PCB board
- 9 Check that all connections are secure before switching on the power.

How It Works

When the LDR sensor detects low light or darkness, the alarm (buzzer) is OFF.

When the sensor detects bright light, the buzzer turns ON.

This works like a **morning alarm** that wakes you up with natural light so you can start your day!

How to Try It

- 1 Switch ON the circuit.
- 2 Cover the LDR sensor or place it in a darker area — the buzzer should be OFF.
- 3 Shine a torch or expose the LDR sensor to bright light — the buzzer should turn ON.
- 4 Try adjusting the distance and angle to see how it responds best.

MORNING ALARM

Plug each module into the correct JST port

Small Projects. Big Possibilities!
